Subject: RE: ethylene glycol and propylene glycol

I am not a researcher but am a person with multiple hypersensitivities to various compounds. After my immunologist determined which compounds caused reactions (both delayed and immediate), he tested my blood and urine for a number of compounds. I was over the occupational limit for propylene glycol !

It could have been because of a significant exposure to a dental product called methacrylate, which was essentiallyglue.

I also at that time had a silicone implant in the space where my left eye used to be. The silicone has since been removed but I did not get retested for presence of propylene glycol. I abhor the smell of glue and related substances. I also used to meet up with a person who worked at an airport and had to spray glycol on the planes. We both could smell it all over him.
